

COPPERGAIN™ 4g

LONG ACTING COPPER CAPSULES

KEEP OUT OF REACH OF CHILDREN
FOR ANIMAL TREATMENT ONLY

PRODUCT DESCRIPTION

COPPERGAIN™ 4g

Long acting oral copper capsules for sheep and calves. Each capsule contains 4g copper oxide equivalent to 3.4g of copper. For the treatment and long term prevention of copper deficiency in sheep and calves and the prevention of congenital swayback in lambs by the treatment of ewes.

DIRECTIONS FOR USE

Administer orally by placing the capsule at the back of the mouth using a suitable applicator gun. For optimum results securely hold the animal to be treated and use the applicator gently to avoid injury. The end of the applicator should be placed over the back of the tongue before releasing the capsule. Make sure the treated animal has swallowed the capsule after treatment.

DOSAGE

Ewes - Administer 1 capsule at tupping or during the first half of pregnancy for the prevention of congenital swayback. If copper deficiency is severe then ewes should be treated during the second or third month of pregnancy rather than at tupping. **Calves under 100kg** - Administer 2 capsules for the treatment and prevention of copper deficiency.

CONTRA-INDICATIONS AND PRECAUTIONS

Do not use other forms of copper supplementation after treatment with Coppergain capsules. Animals should only be treated if copper deficiency has been diagnosed or is an existing risk. Caution is advised before treating housed sheep or breeds, such as North Ronaldsay, known to be susceptible to copper toxicity.

STORAGE

Store in original container, tightly closed and in a cool, dry place. Protect from freezing, moisture and direct sunlight. Store below 25°C

WITHHOLDING PERIOD

Meat & Milk - **Zero days**

PACK SIZE

Contents: 50 x 4g capsules
